owner	Platform Engineering
stale	false

Deployment Principles

All API services deploy through GitHub Actions. Direct production changes from a developer laptop are prohibited except during an approved emergency change.

Pipeline Stages

- Unit tests and linting run on pull requests.
- Container build and image scanning run after merge to main.
- Staging deployment must pass smoke tests before production promotion.
- Production uses a 10 percent canary for the first 15 minutes.

Rollback Procedure

Use `deployctl rollback --to` when error rate exceeds 2 percent for five minutes or p95 latency doubles from baseline. Record the rollback reason in the deployment log.

Feature Flags

Risky behavior changes should be protected by feature flags. Flags must have owners and expiration dates.

Observability

Every API must emit request count, error rate, p50/p95 latency, dependency latency, and deployment version.
